

## Project Update: July 2013

A team including a research assistant and two local people were taken in the Papekharka where *D. hatagirea* was found. The number of the *D. hatagirea* plants were observed along with its associated species. GPS points were taken according to the grid coordinates fitted in ArcGIS 9. 100 circular plots were used with 2.82 m radius and *D. hatagirea* was identified. Since, it was a rainy season, the inventory proved to be a little bit difficult for us. However, it was really adventurous and task was completed in time.
