

### **Project Update: April 2003**

Conservation activities for supporting the Black vulture in Bulgaria were implemented during the first project phase: placement of 1560 kg food onto a specially built feeding platform; implementation of monitoring following the feeding; construction of additional facilities for providing drinking water and dust-bathing; repair of the road approaching the feeding platform; building of two artificial nests.

Guide training events were carried out and a work plan for the next reporting period was elaborated – organization of an expedition, final construction works, republication of promotional materials on the Black vulture and human resource development.
