

Project Update: September 2015

The Bee Project and restoration of Magombera Forest are well proceed. Bees have started entering in the beehives. The area seem to have a good number of bees. Most of trees planted in Magombera forest for restoration initiatives are also growing well. About 70% of planted trees are in good condition. We took the measurement on the trees height to identify the changes from time to time. It shows there is significant changes in growth.
