

Project Update: March 2016

Protocol and instrument for monitoring the coral reef, mangrove and seagrasses have been developed. Pilot testing has been conducted for seagrass monitoring protocol and instrument. The pilot testing started from using the key identification guidance developed to identify seagrass species. Then conduct monitoring on seagrass. We then made herbaria for seagrass as one of the tools to increase local youth knowledge on seagrass and thus increase the data quality of their monitoring effort.
