

## Project Update: February 2016

Much progress has been made on the ongoing project *“Local gene flow, dispersal, and establishment of mangroves in Cameroon: combined revelations from morpho-physiological observation”*. One manuscript has already been submitted and one is in preparation yet we are still carrying out field work. We have successfully completed dispersal experiments of mangroves of the Cameroon Estuary complex. Capture-mark-release-recapture experiments were completed in January 2016. All growth and establishment experiments are still ongoing, with remarkable observations so far.
