

## Project Update: January 2017

The 1st phase of otter tracker application development includes database architecture, server side and simple client for collecting data. Database architecture has been composed using templates from book Reuther et al. (2000) *Surveying and Monitoring Distribution and Population Trends of the Eurasian Otter*.

It looks like attachment named "Otter tracker".

In coming period (after this first phase) we will build another parts of application relating to otters diet with 3D views of the fish bones, roadkill records with the schematic view of the otters body and with possibility displaying physical measurements, and 3D otter skull view with measurements, and part for snow tracking otter with front and back schematic paws views with measurements.

This is all powered by Dragana Kostic (developer), Andrej Mrkovacki (developer) and Nikola Skendzic (designer).
