

## **Project Update: February 2017**

Our project, Biodiversity Conservation Initiative in Mount Ungaran has been conducted. We collaborated with the Jogja Birdwatching Community (PPBJ – Paguyuban Pengamat Burung Jogja), Indonesian Raptor Research and Conservation Network (RAIN - Raptor Indonesia), and SHUI. Based on our research we had distribution data of Javan hawk eagle, based on the average altitude, and is known it encounter at an altitude of 1155 m asl.

Motivate people of Mt. Ungaran to become a citizen scientist also made to the youth group in the village of Medini. We discussed with members of youth regarding the condition of the biodiversity of Mount Ungaran. Then we held a training session about bird identification and conservation. They were very enthusiastic to join this activity.

We inform you that we made free website about this project:
