

Project Update: July 2016

We did a preliminary survey in Mt. Ungaran. The survey was conducted together with the students of forestation, study group of Forest Resource Conservation Department, Forestry Faculty of Gadjah Mada University (UGM). Not only did the survey Javan hawk course, but we also noted the presence of other birds that we encountered. From these activities we use as a reference in determining the grid block on the map.

The field survey to collect distribution and habitat characteristic information of Javan hawk eagle in Mt. Ungaran we guided by grid blocks. Grid Blocks will create with an area of 1 km² each in the whole area Mt. Ungaran.
