

Project Update: July 2016

I started the fieldwork in Una's landscape in the last month and I have placed the camera traps in cacao agroforestry to register the mid-sized mammals. Happily, we have registered species like *Callithrix kuhlii*, *Cerdocyon thous*, *Cuniculus paca*, *Dasyurus novemcinctus*, *Didelphis aurita*, *Eira Barbara*, *Leontopithecus chrysomelas*, *Leopardus wiedii*, *Procyon cancrivorus*, *Puma yagouaroundi* and *Tamandua tetradactyla*. A lot of species are using the cacao agroforestry, however, we have registered more generalist species than the specialists. And some species that are hunted by population were seldom registered. The farmers and residents are accepting our work and were very satisfied when they saw the photos of animals that were registered in their proprieties.

The researcher (Aluane) in the cacao agroforestry's landscape in Una, Brazil

A mid-sized mammal, tayra (*Eira barbara*) detected in camera trap at Una city, Southern Bahia, Brazil

A mid-sized mammal, Jaguarundi (*Puma yagouaroundi*) detected in camera trap at Una city, Brazil
