

Project Update: April 2017

Following the proposed chronogram, we finalised the sampling and the specimen identifications. As highlights, we provided 42 additional new species records for Serra da Bodoquena region and we have sequenced 70 species. Also, we submitted two scientific manuscripts using these results. The first manuscript, with a species checklist for the region, was submitted to Biota Neotropica, and the other one, about molecular information, to Plos ONE. Our results have already been reported to the NGO "Neotropica do Brasil", which will help us in the advertising material. As proposed in the project, I bought the website domain <https://www.environmentalsentinels.com/>. Unfortunately, we did not capture or observe other specimens from both endangered species. This information shows the rarity to find them and the need to preserve them. Finally, as recognition of our work, I was invited to help in the creation of the 1st Red List of Threatened species of Mato Grosso do Sul state.

The preparation and curation of dragonflies.
