

## Project Update: March 2017

Since the last report in December 2016, we have carried out two more data collection expeditions. The state of Espírito Santo is facing an outbreak of yellow fever and this has caused the deaths of several primates throughout the state, including in our area of study. We still do not know the size of the impact of this dramatic event on populations of primates. In conjunction with these two expeditions, we held two workshops with the local population to raise awareness of the need to mitigate poaching in the region.

Local school students at the workshop to mitigate poaching in the region.
