

Project Update: November 2016

The actual field data collection began effectively from first week of July 2016 on bird diversity along with vegetation structure and composition surveys. Besides that, secondary data were also gathered from local communities and FMU staffs. The survey team carried out the fieldwork as per the survey protocol reflected in the proposal and hence completed the summer season data collection. Yet, the major impediment we faced during the data collection period was that both the study areas were located in higher altitude and most of the time these areas were covered by fog and rain which is against the birding survey protocol. Other than that, everything worked successfully and looking forward for the same in the remaining months as well.
