

## Project Update: June 2007

In order to identify the 'Plus specimens' in terms of CPT content, the populations of *N. nimmoniana* at Khalapur and Amboli from northern Western Ghats are identified and marked.

Bark samples were collected and subjected to CPT analysis. Seeds were collected from these localities to check the provincial variation in germination. Percentage germination at Amboli was found to be 70-75% as against 15-20% at Khalapur.

Marking populations in the wild
