

## **Project Update: May 2017**

During this month we organised field trips with the students of biology and ecology from the Faculty of Sciences, University of Banja Luka, with the aim to educate them about methods (photo trapping, noninvasive sampling) which we have employed in our projects. Field trips were organised over 2 days in the localities from the project.

We gave them a theoretical introduction about methods we apply and after that we started with the practically work during which students learned:

- i) How and where to place photo traps.
- ii) How to perform noninvasive sampling.

We will organise a lecture for students, at the Faculty of Sciences, University of Banja Luka, with the aim to educate them about genetic analyses which we have applied and about software which we have used in DNA analyses, as well.

### **The first day**

**The second day**
