

Project Update: May 2008

Field survey for mammal's identification is being conducted since February 14th and since then camera-traps and temperature data loggers are recording in the field. A total of 9 species (*Nasua nasua*, *Procyon cancrivorus*, *Cerdocyon thous*, *Conepatus chinga*, *Dasyopus novemcinctus*, *Dedelphis albiventris*, *Sus Scrofa*, *Mazama gouazoubira*, *Oncifelis geoffroyi*) had been photographed.

In addition, habitat characterization was conducted from January to March. For a total of 30 sites, we collected different kind of information such as: tree vegetation species, DBH, canopy coverage, ground coverage, terrain slope, and vegetation structure (vegetation layers). Currently, I am working with the landscape analysis and beginning with the data analysis.
