

Project Update: January 2018

The environmental education and conservation outreach programmes were conducted throughout December 2017 in collaboration with park and forest officials, local administration and communities, nearby students as well as teaching faculties. The collaborative awareness programme focused on the findings of the project, discussing and sensitising the basic information on the threats to amphibians and their importance for the healthy ecosystem. With the collaboration of Tashigang Forest Division and local people, a cleaning campaign was also organised along the roads and settlements which are nearby Drangme Chhu River.

Presentation to the scientists of Forest Research Institute about the findings of the project was done and also, a short review on the topic: "[Growth in amphibian knowledge of Bhutan](#)" was accepted by the 'Current Science,' in the 'Correspondence' section to further disseminate the current status of amphibians in Bhutan to the international communities.
