

Project Update: March 2018

The site visit for detection of salamander was done in three different seasons of the year. For the first and second time the team was unable to detect the species in considered area of the project. At the third survey during winter season, the Paghman salamander was detected by team members and identified. All physical measurement was done at the spot and the specimen was released back to its niche.

The specimen was collected from the shades shrubs in cool site of Paghman near tributaries of Paghman stream in $34^{\circ} 36' 54.03''$ N and $68^{\circ} 54' 45.98''$ at the elevation of 2634.99 meters.
