

## Project Update: July 2018

During the first part of the project, we had a preliminary meeting with administration of National Park Kozara where we agreed the cooperation. All the necessary permits for doing the research are obtained.

During the April we have finished area research and mapping the most suitable sites/habitats and further, during April, May and June 2018 we have finished with the fieldwork for spring period using the mist netting and bat detection techniques, but also inspection of the sites with possible bat presence.

We have also finished the text for the new brochure and informative boards called "Bats of National park Kozara" containing information about different registered species of bats registered during the first RSG. These publications are now in designing process.
