

## Project Update: June 2018

We have just begun the project. The first field trip was made between June 12th and July 1st 2018.

The main purpose of this field trip was to choose the count points and to mark them in printed maps and in a GPS. Finally we marked 62 count points in each sample zone, so totally we marked 186 count points. We also marked them with flagging type in the field, to recognise them easily in the near future. We have some logistic problems accessing different sites, but the main rule was fulfilled: each point has to be apart from other points with a minimum distance of 300 meters and each point count has to be located in vegetal cover of: shrubbery or forest. Three zone samples were defined and the next step is the begging of sample process, planned in July 16th.
