

## Project Update: May 2019

We have had a delay on the start date. So, we are a bit delayed on the chronogram proposed. However, we have been working hard to complete the project in time.

We are working in collaboration with Costa Rica Wildlife Foundation to increase our scope. This foundation is a well-recognised organisation in Costa Rica that develops conservation initiatives to ensure the prevalence of wildlife and its habitat. With this alliance we will start an invasive species programme to address this environmental problem.

We have made progress with the website to promote the project and inform about the biological invasion of people in general; it can be accessed at: <http://coqui.invasivespeciescr.org/>. However, there are still some details that must be corrected before its official launch.

We present a talk at a meeting of the biological corridor where the study area is located. This was very useful because we gained potential allies for the implementation of the project.

Good photos and videos have been recorded about the fauna of the site, now we are editing the videos and the information materials to show the fauna that we want to protect and how the common coqui frog could be a threat to it.
