

Project Update: February 2019

We have currently surveyed for Odonata in freshwater habitats in the Pra Basin. We focused on two major rivers (Birim and Offin Rivers) and their tributaries in the Pra Basin.

The survey was done in both the wet and dry season. The wet season sampling occurred from June to October 2018, while the dry season sampling was done from December 2018 to February 2019. We have recorded a total of 38 Odonata species along the Birim River and 43 species in the Offin River and their tributaries. Some notable and rare species are the *Elatoneura villieri*, *Heliaechna fuliginosa* and *Sapho bicolor*. We have currently initiated our community education and awareness creation campaigns in selected communities fringing these two rivers.

Project team members

Acisoma inflatum recorded along the Offin River belt.

Bradinopyga strachani recorded along the Birim River.
