

## Project Update: March 2019

### Project Activities

Monitoring of transplanted trees has been done. Where needed, replacement of trees was done. Also, where trees grew too much, new ties to the cane were done, avoiding the leaning of trees. Regarding the substrate test, although it is not finished, the compost from poultry industry derivatives shows promising results as similar growth is observed when compared to other substrates.

- Talks: we continued doing talks about the project.
- Field activities:

Tying new points to the cane to avoid leaning

Substrate test showing one of the treatments through 3 30-days periods

#### Next quarter activities

- Field monitoring of transplanted trees.
- Substrate test in the greenhouse.
- A new group of trees will be produced to take to the field next season.
- Monitoring of grass species changes.
- Diffusion of the project in social networks.
