

Project Update: April 2019

The data collection was done covering the whole country except a few places where it was not a potential habitat of the langur. During the field visit the GPS coordinates of every sightings were recorded. 17 occurrence points were recorded for golden langur and six occurrence points were recorded for capped langur. Further occurrence records will be added through secondary sources for the construction of the model. Golden langur were mostly seen at Zhemgang followed by Trongsa and least was found at Sarpang. On other hand, capped langur were difficult sight. We were able to sight capped langur at four dzongkhag Mongar, Zhemgang, Pemagatshel and Samdrupjongkhar.
