

## Project Update: December 2019

The first two months of bat captures are over. We have captured over 100 bats from more than 15 species already, and pollen samples have been collected from all of them.

We have collected pollen samples from over 40 plant species from the park to build our reference collection. The number grows after each phenological assessment.

The funds so far have been used mostly for fuel and for food during the field campaigns. FINATEC has been managing the financial transferences when needed. I will purchase the chemicals and materials needed for pollen analysis in early December 2019.
