

Project Update: March 2021

- I have assessed 12 forest patches for the second time in January and March 2021 as well as four new additional forest patches in the region.
- So far, I have found that colobus monkeys are the most dominate and are found in the highest encounter rate among the primate species of the region.
- Most of the forest patches contain so astonishing tall and think trees.
- In addition, I recorded additional threats to each forest patches and primate species in the region.
- I observed that all forest patches are allowed for livestock grazing and firewood collection freely.
- Local farmers also illegally cut big trees for timber production.

A. Views of primate species of the region

B. Zewdu's and some scouts during primate surveys

C. Views of different forest patches

D. Photos that show threats to primates and their habitats

E. Honey production within the forest

F. Some of the amusing trees within the forest patches
