

## Project Update: August 2020

We finished the preliminary survey from 4-11 August 2020. We selected three primary sites based on previous records of *Rhinagrion tricolor* population. The locations are the Kali Kencana River, river around the mining area, and the West Nuskambangan Nature Reserve river. Gladly we found nine individual *R. tricolor*. We also recorded a total of 42 species of odonates. Includes two species that were targeted (*Prodasineura delicatula* and *Coeliccia lieftincki*). *P. delicatula* was quite common and was present at all survey sites. *C. lieftincki* has not been found at the survey site. This preliminary survey will be used as background information on the next survey.
