

Project Update: October 2020

We finished our first field survey from 15-21 September 2020. The survey was nicely done. We chose three main locations based on a preliminary survey in August 2020. The locations were Kali Kencana River, stream around mining area, and West Nuskambangan Nature Reserve river. River and stream flow is reduced in September. Luckily, we found 10 individuals of *R. tricolors* in Kali Jati River. *Prodasineura delicatula* is quite common and present in all survey locations. A female *Coelliccia lieftincki* was found in a dried forest stream during tracking to Kali Kencana River. Another *C. lieftincki* site was found in a dried river near to SBI's mining area. I found four individuals in this site. These three species were found in primary, undisturbed forest with dense canopy. I will move to the East Nuskambangan Nature Reserve for the next survey.
