

## **Project Update: December 2010**

The communication and popularisation activities have been our main occupation from November to December 2010. We have printed the photos for the photo exhibition in the Ecology Center. Our list of endemic threatened species contains only 5 species but we prepared the information and photos of 28 rare and protected plants from Magadan Region, including these endemic species. We have presented these materials to the Ecology Center for Teenagers where they can be used for their lectures (Elena Bydantseva), presentations and exhibitions.

The scientific activities include the preparation of the digital map of distribution of threatened plants in the Magadan surroundings. We have looked at certain relations of the species distribution to edaphic factors of their habitats. We continue the observations of environmental conditions on the model plots (blanket of snow, winds, etc.).
