Project Update March 2024

Rufford I.D.: 42068-1
Project Title: Mapping Galapagos Invaders with Drones and Machine Learning: An Estimation of Spread Rates of Invasive Plants and Identification of Management Keys for Endemic

Update: The project in Ghana continues very well, our trip in February was really successful. We advanced a lot with the transects and studying the movement and breeding ecology of the vultures, in addition to the population dynamics (goals 1-3 of the project). We managed to tag a vulture with a GPS transmitter, and we are currently receiving information on its movements, which can help us a lot to understand the risks they are facing and the reproductive ecology of the species and population dynamics.
